Set up VMachines using VirtualBox (https://www.virtualbox.org/wiki/Downloads):
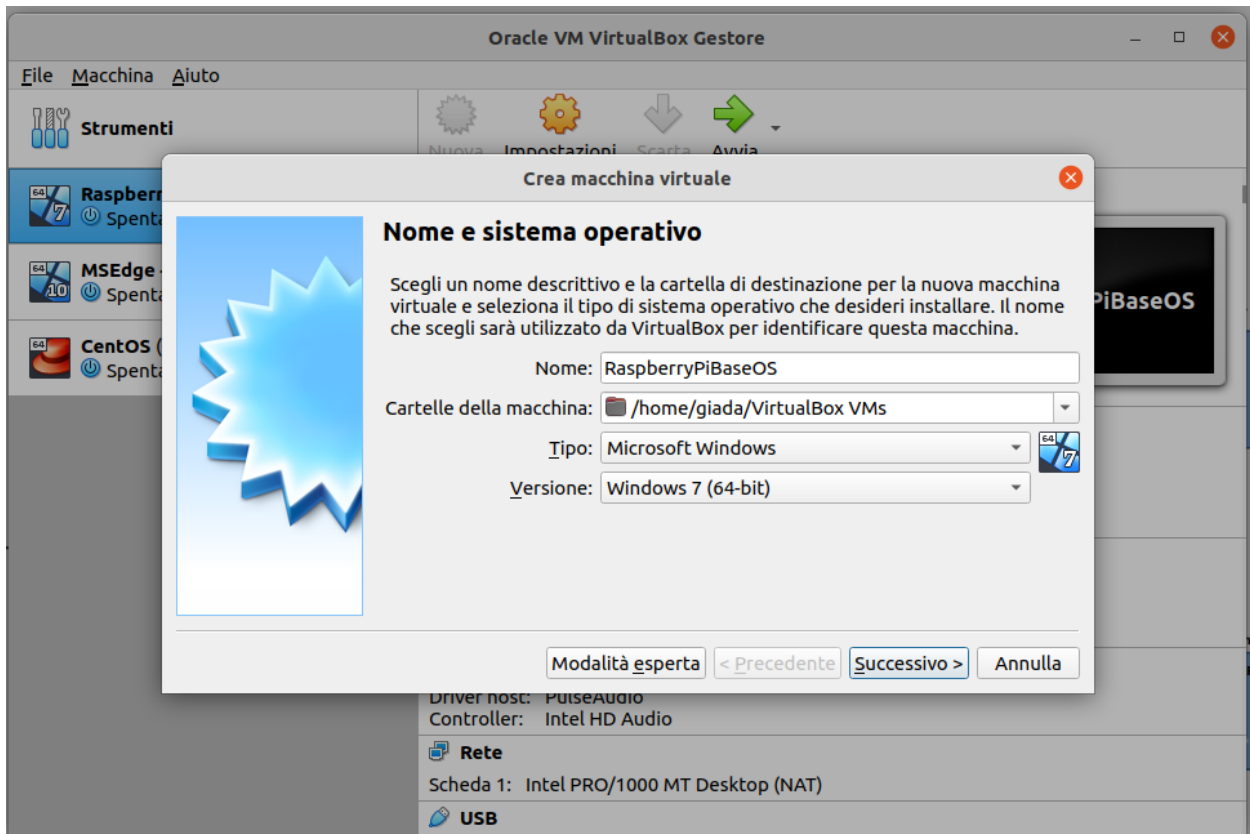

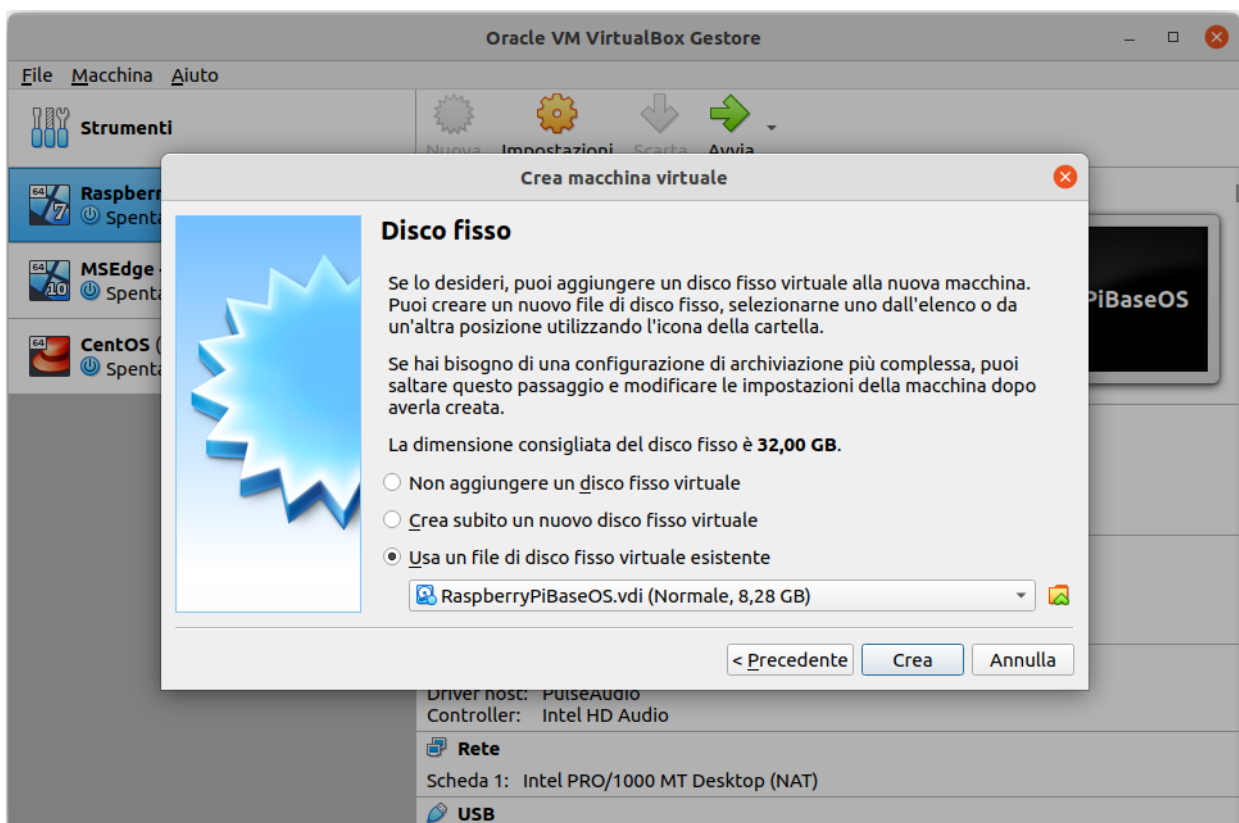

New; Insert name (like RaspberryPiBaseOS or CentOS9 or CentOS8);

Insert as a disk Raspberry.vdi and create; Same for CentOS 8 and CentOS 9;

After creating Vms in Virtual Box we have to include them in GNS3

Click Edit > Preferences ; Set a New VirtualBox VM; choose among list and click on finish;
NOTE: the options "Use as a linked base VM (experimental)" in general settings and "Allow
GNS3 to use any configured VirtualBox adapter" in network MUST be selected (Adapters is 1 as
default, you can change based on what you need (how many links you need) in the structure, you
can also modify later on single machine in the structure > right click > Configure)

Same steps for each one of them, Raspberry, CentOS 8 and CentOS 9.

Now you will find these machines in GNS3's devices; you can drag and drop in the structure
:)
